

the weight of modern aircraft, has made it necessary to construct concrete runways, often of considerable extent, on the principal aerodromes in use. A number of special units of the Royal Engineers had consequently to be raised, and a large amount of plant, grass seed and materials had to be provided.

Frontier Control.

19. The sector of the frontier occupied by the British Expeditionary Force presented a very difficult control problem. There were initially over ten thousand Belgians working on the beet harvest in the British zone and on the average considerably more than twenty thousand local inhabitants passed the frontier daily on their normal business.

The strength of the frontier organisations charged with the control of the frontier traffic had been seriously reduced on mobilisation. It was therefore essential to supplement the normal machinery of control.

The system devised in co-operation with the 1st French Region and the commander of the fortified sector of Lille included a primary control on the frontier proper and a secondary control on the line of the foremost anti-tank obstacle wherever the latter did not coincide with the frontier.

Co-operation with the French authorities has been close and harmonious throughout. The Field Security Police have played an important role in this unusual and difficult task and have contributed largely to the success of the organisation.

Intelligence.

20. Conditions on the operational side of intelligence work in the field have naturally been abnormal. Much valuable preliminary work and re-organisation has been carried out and full advantage has been taken of the unusual situation, to complete the training of the Intelligence staffs. Co-operation with the French Intelligence service has been close and cordial.

It became apparent at an early date that the staff and organisation provided for dealing with wireless intelligence were inadequate for this increasingly important branch of operational intelligence. The expansion of the wireless intelligence units is now, therefore, in progress. Closest co-operation has been maintained with the French Wireless Intelligence Service.

It has been necessary to increase the air intelligence section of the Intelligence branch at General Headquarters, which has performed valuable work in the collection and distribution of information.

The problem of security has presented many unusual difficulties. This has been largely due to the long period of inactivity, the geographical position of the Force, the length of the Lines of Communication, and the congestion in the rear areas owing to the presence of evacuees. The French authorities have co-operated most closely in the matter of civil security and have throughout given all the assistance in their power.

Censorship.

The postal censorship discipline of the British Expeditionary Force is on the whole good. Very considerable increases in personnel have been found necessary in order to impose the

requisite selective censorship on the abnormally large number of letters now despatched daily. Extremely useful reports on the outlook of the British Expeditionary Force as a whole and on its relations with the local French inhabitants are produced periodically. These are based largely on information supplied by the censorship organisation supplemented by reports from the Field Security Police.

Publicity and Propaganda.

The section of the Intelligence branch dealing with publicity and propaganda has worked in close co-operation with the organisations concerned both in England and France, and has fulfilled a rôle which has assumed far more importance than in previous campaigns. Much has been done to counter German propaganda. Material has been provided for the Miniform Committee in Paris in this connection, and information bulletins are issued periodically to all units of the British Expeditionary Force.

Cipher Personnel.

Up to date the whole of the cipher work in the Force has been carried out most efficiently by Army Educational Corps personnel. This personnel is now required to revert to its normal duties in the United Kingdom and is being replaced.

Press.

21. The significance and requirements of the Press and of the press and cinematographic publicity in the field in modern war have proved greater than was appreciated prior to the outbreak of hostilities. Shortly after mobilisation a Public Relations unit was hastily formed and incorporated in the Intelligence branch of General Headquarters.

Since its formation in October this unit has administered and arranged facilities for a total of some fifty-five War Correspondents permanently accredited to the British Expeditionary Force, besides representatives of the principal news-reel companies. Some sixty visiting editors, correspondents, broadcasters and cinematographers, in addition to selected representatives of the neutral Press, have been given facilities for visiting the Force.

There has also been a small unit of the British Broadcasting Corporation with the Force since October, and facilities have been provided for selected official photographers to meet the requirements of the British Press.

The Newspaper Proprietors Association generously makes a large supply of papers available free daily for the Force. In the matter of distribution, close touch has been kept with them and with the "Continental Daily Mail," which supplies the troops with their latest news.

The Press and photographic censorship is now working efficiently and co-operation with the French is close and harmonious.

Development of the Rearward Services.

22. The work of the administrative staffs and services in back areas has in many respects been fully as heavy as it would have been if fighting had been in progress. It was their duty, while maintaining a continually growing force, to make and put into execution long term plans in preparation for the arrival of future contingents.
